Violet – Apologies for the delay in responding. Here's a brief recap.

In 2012, EPA selected a \$60 million interim remedy for the FMC Superfund site that consists of placing two types of engineered cover systems over the soil contamination at the site. One cover system is protective of gamma radiation and the other is designed to prevent infiltration of rainwater and snow melt into the phosphorous-contaminated site soil. In addition, groundwater at the site will be treated to remove contaminants. EPA selected this remedy using the process outlined in the Superfund law, and it is similar to site remedies used throughout the country. No alternatives were identified during the site investigation that could safely excavate and treat site contamination. EPA is currently reviewing design documents for the cleanup, and work is expected to begin this summer. Construction work is expected to take approximately 2 to 3 years to complete.

Because the Shoshone-Bannock Tribes opposed the selected remedy, EPA agreed to fund and oversee an additional independent review of potential excavation and treatment technologies to determine whether there are any viable technologies not identified during the site investigation.
